PRECISELY ROTATE AND SET YOUR DARTBOARD EXACT SPIRIT LEVEL DISPLAY MAGNETICALLY SECURES TO THE SPIDER

The right flights for you must match your particular darts, producing enough aerodynamic lift to stabilise them in-flight but not so much as to throw them off-course. UniLab and Unicorn Sigma darts use sophisticated mathematics to achieve this matching, but you can try yourself using the following table, some experimentation, and maybe a UniLab Flight Selector Kit!

The table below lists the surface area for current Unicorn flight shapes, a Lift Factor relative to the highest lift, Big Wing flights, and a related Stability Factor. Flight weight also affects stability and, although the Stability Factor shown is for a standardised material, the table's last row shows the weight of a representative Plus flight in different materials.

Heavier materials provide slightly less stability but improved durability, Maestro additionally offers more rigidity and therefore consistency of flight, and Q aims to provide this in a lighter flight. There are no hard-and-fast rules on flights matching, but as a hint to using the table, if your darts are landing in the board at varying angles, try a higher stability flight, if they're landing true, a smaller, lower lift flight may improve accuracy, land flatter, and reduce bed-blocking.
